# Serpentic Agent Studio

Demo video script | about 6-7 minutes

**Before you record**

- Make sure the SerpApi and LLM keys are saved on the Connectors page.
- Run the workflow once beforehand so you know it works, and keep an example result ready in case a live run is slow.
- Use a trip with real future dates. The examples use Delhi, mid-December.
- Close other apps first, so the dev server is not stopped by low memory.
- Read the shaded text aloud. Lines marked [Screen] are actions, not narration.

## 1. Intro

0:00 - 0:30

*[Screen] Dashboard.*

> Hi, I'm [name]. This is Serpentic Agent Studio, a tool where you build AI agents on top of live SerpApi data, and then chain them into workflows. Instead of one chatbot guessing, you get a team of specialists that each use real tools, for flights, hotels, places and more. I'll show you how it works with a travel planning example.

## 2. Connectors

0:30 - 1:10

*[Screen] Connectors page.*

> It starts with Connectors. Each connector is a set of tools an agent can call. Google Flights, Google Hotels, Hotel Photos, Travel Explore, TripAdvisor places and reviews, and Google News, plus a set of everyday tools. You paste your SerpApi key once, it is checked and stored encrypted on this machine, and every connector is ready. You can also add your own custom MCP servers.

*[Screen] Point at the LLM setup.*

> Here I choose the model that powers the agents' thinking.

## 3. Creating an agent

1:10 - 2:40

*[Screen] Agents, then New agent.*

> Now let's build an agent. I give it a name, and I describe the job in plain words.

*[Screen] Type this description:*

```
Find me the cheapest flight and show the exact price, flight numbers and timings I need to book it.
```

*[Screen] Select the Google Flights and Flight Deals connectors, then click Generate structured prompt.*

> In a few seconds it writes a structured prompt: role, goal, tools, process, inputs, output format and rules. It also picks the job title from my description, here 'Flight Scout'. I can edit the title or any

part of the prompt.

*[Screen] Show the job title field filled in; edit one word to show it is editable.*

I can test the agent right here before publishing.

*[Screen] Open the test panel and type:*

```
Delhi to Goa, 12 to 16 December, 2 adults.
```

It calls the flights tool and returns the cheapest option with the exact price, flight numbers, times, airports and where to book.

*[Screen] Pause on the result, then click Publish.*

## 4. Chat with agents

2:40 - 3:20

*[Screen] Chat page.*

Every agent is also available in Chat. The list shows each agent's name, its role underneath, and the last message, so I always know who does what.

*[Screen] Open Aarav and ask one short question, or show a previous chat.*

## 5. The workflow

3:20 - 5:40

*[Screen] Workflows, open Dream Trip Planner.*

Single agents are useful, but the real power is chaining them. This is the Dream Trip Planner. One request goes in, and a team of agents works through it step by step.

*[Screen] Walk left to right along the canvas.*

**1.** Your request. I just type what I want in plain words.

**2.** Kabir, the Destination Scout, picks the best place to go. He suggests locations only, no prices.

**3.** An approval step. The run pauses so I can confirm the destination before anything else is searched. That keeps a human in control.

**4.** Aarav finds the cheapest flight, with the exact total price, flight numbers, times, airports and where to book.

**5.** Tara finds top-rated TripAdvisor places and builds a day-by-day itinerary.

**6.** Meera finds the best hotel deals.

**7.** Zoya fetches real photos of the top hotels.

**8.** And finally a trip summary: one clean report combining everything.

*[Screen] Click Run and type this request:*

```
Plan a 4-night trip from Delhi, 12 to 16 December, for 2 travellers. We like
beaches and good food.
```

*[Screen] While it runs, show the steps lighting up.*

> Each step shows which tools it is calling in real time.

*[Screen] When the approval appears, open Approvals, then approve.*

> Here's the approval. I can read the suggested destination and approve it.

*[Screen] When it finishes, scroll the summary slowly.*

> The final report has the destination, the cheapest flight with exact price and full details, the itinerary, hotel options and photos. Prices come only from the flight and hotel agents, so nothing is guessed by the other agents.

## 6. Dashboard and control

5:40 - 6:10

*[Screen] Dashboard, then Runs.*

> The dashboard tracks runs, tool calls and success rates. Every run keeps its steps, outputs and tool calls, so it is easy to see what happened and to debug.

## 7. Closing

6:10 - 6:40

> To recap: connect live data, create agents in plain English, chat with them, chain them into workflows with approval steps, and get one clear result. Travel is just the example. The same approach works for news monitoring, research, price tracking and more. Thanks for watching.

## Extra example prompts (Q&A or a second take)

- Cheapest flight from Mumbai to Bangalore on 20 December, one way, 1 adult.
- Weekend trip from Bengaluru, 3 nights in January, we love mountains and food.
- Find hotels in Goa with good reviews for 14 to 17 December and show photos.

## Notes

- Do one full workflow run before recording; live results depend on current fares and hotel data.
- The Weather Forecast connector has been removed, so do not mention weather.
- If the live run is slow, pause the recording during the wait and cut it in editing.
